Knowledge Graph — Biais Cognitifs appliqués au Web

Projet : Web Mining & Semantics

Pipeline end-to-end :

```
Web Crawling  →  Preprocessing  →  NER + Relations
→  Knowledge Graph (RDF)  →  Ontologie (RDFS/OWL)
→  Raisonnement (SWRL)  →  SPARQL  →  KGE  →  RAG Assistant
```

Installation des dépendances

```
# Installation des packages nécessaires
import sys
!{sys.executable} -m pip install httpx trafilatura spacy rdflib requests --quiet
!{sys.executable} -m spacy download en_core_web_sm --quiet

# Création des dossiers de travail
import os
for folder in ['data', 'knowledge_graph', 'kge_data', 'logs']:
    os.makedirs(folder, exist_ok=True)

print('✓ Installation terminée')
print('✓ Dossiers créés : data/, knowledge_graph/, kge_data/')
```

```
   ━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━ 132.6/132.6 kB 8.8 MB/s eta 0:00:00
   ━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━ 615.4/615.4 kB 20.7 MB/s eta 0:00:00

   ━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━ 300.4/300.4 kB 11.6 MB/s eta 0:00:00
   ━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━ 296.7/296.7 kB 17.1 MB/s eta 0:00:00
     ━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━ 12.8/12.8 MB 68.2 MB/s eta 0:00:00
✔ Download and installation successful
You can now load the package via spacy.load('en_core_web_sm')
⚠ Restart to reload dependencies
If you are in a Jupyter or Colab notebook, you may need to restart Python in
order to load all the package's dependencies. You can do this by selecting the
'Restart kernel' or 'Restart runtime' option.
✓ Installation terminée
✓ Dossiers créés : data/, knowledge_graph/, kge_data/

Web Crawling

```
"""
==============================================================================
ÉTAPE 1 — WEB CRAWLING & NETTOYAGE
==============================================================================
Projet  : Knowledge Graph des Biais Cognitifs appliqués au Web
Cours   : Web Mining & Semantics

Objectif :
  Collecter des pages web riches sur les biais cognitifs (confirmation bias,
  echo chambers, filter bubbles, fake news...), nettoyer le HTML avec
  trafilatura, et stocker le contenu utile en JSONL.

Pipeline :
  1. Vérification de robots.txt (éthique)
  2. Téléchargement HTTP (httpx)
  3. Extraction du contenu principal (trafilatura)
  4. Filtrage : pages < 500 mots rejetées
  5. Stockage en JSONL : {url, title, text, word_count, timestamp}

Sortie : crawler_output.jsonl
==============================================================================

"""
==============================================================================
ÉTAPE 2 — PREPROCESSING (NETTOYAGE & SEGMENTATION)
==============================================================================
Projet  : Knowledge Graph des Biais Cognitifs appliqués au Web
Cours   : Web Mining & Semantics

Objectif :
  Préparer le texte brut pour l'extraction d'information.
  À ce stade : toujours PAS de connaissance — juste du texte propre.
  (Principe du cours : "We collect only text, not knowledge")

Traitements :
  1. Suppression des lignes répétitives / boilerplate résiduel
  2. Normalisation des espaces et caractères unicode
  3. Segmentation en phrases (pour le dependency parsing)
  4. Filtrage des phrases trop courtes (< 5 mots)

Entrée  : data/crawler_output.jsonl
Sortie  : data/preprocessed.jsonl

Extraction d'Information (NER + Relations)

```
"""
==============================================================================
ÉTAPE 3 — EXTRACTION D'INFORMATION (NER + RELATIONS)
==============================================================================
Projet  : Knowledge Graph des Biais Cognitifs appliqués au Web
Cours   : Web Mining & Semantics

Objectif :
  Transformer le texte propre en FAITS structurés.
  On passe de TEXTE → CONNAISSANCE (moment clé du cours).

  "Text may contain knowledge, but it is not knowledge" — CM

Pipeline :
  1. NER spaCy : détecter les entités nommées (PERSON, ORG, etc.)
  2. Entités custom : détecter nos entités domaine (biais, effets, contextes)
  3. Dependency parsing : extraire des relations (sujet + verbe + objet)
  4. Co-occurrence : entités dans la même phrase → relation "relatedTo"

Entités ciblées (custom pour notre domaine) :
  COGNITIVE_BIAS  → Confirmation Bias, Echo Chamber, Dunning-Kruger...
  PLATFORM        → Facebook, Twitter, YouTube, TikTok...
  EFFECT          → Polarization, Radicalization, Misinformation...
  BEHAVIOR        → Sharing, Clicking, Engagement, Opinion Formation...
  CONCEPT         → Algorithm, Recommendation, Filter Bubble...

Relations extraites :
  affects         → (Bias, affects, Platform/Effect)
  causedBy        → (Effect, causedBy, Bias/Platform)
  appearsIn       → (Bias, appearsIn, Platform)
  reinforces      → (Platform, reinforces, Bias)
  leads_to        → (Bias, leads_to, Effect)
```

```

Construction du Knowledge Graph (RDF)

```
"""
==============================================================================
ÉTAPE 4 — CONSTRUCTION DU KNOWLEDGE GRAPH (RDF)
==============================================================================
Projet  : Knowledge Graph des Biais Cognitifs appliqués au Web
Cours   : Web Mining & Semantics

Objectif :
  Transformer les faits extraits (CSV) en un graphe RDF structuré.

  Le graphe représente les biais cognitifs, leurs contextes d'apparition
  sur le web, et leurs effets sur le comportement en ligne
```

```
  sur le web, et leurs effets sur le comportement en ligne.

Structure du graphe :
  NŒUDS (entités) :
    - CognitiveBias    → Confirmation Bias, Echo Chamber...
    - Platform         → Facebook, YouTube, Twitter...
    - Effect           → Polarization, Radicalization...
    - Behavior         → Selective Exposure, Sharing...
    - Concept          → Recommendation Algorithm...
    - Person           → Chercheurs, auteurs cités

  ARÊTES (relations) :
    - affects          → (Bias → Platform/Effect)
    - causedBy         → (Effect ← Bias)
    - appearsIn        → (Bias → Platform)
    - reinforces       → (Platform → Bias)
    - leads_to         → (Bias → Effect)
    - relatedTo        → relation générique

Exemple de triplets :
  (Confirmation_Bias, affects, Social_Media)
  (Echo_Chamber, causedBy, Recommendation_Algorithm)
  (Filter_Bubble, appearsIn, Facebook)
  (Polarization, causedBy, Echo_Chambers)

Sortie :
  knowledge_graph/biases.ttl     (Turtle — lisible humain)
  knowledge_graph/biases.nt      (N-Triples — pour KGE)
  knowledge_graph/biases.rdf     (RDF/XML)
  knowledge_graph/biases.json    (JSON-LD)

==============================================================================
ÉTAPE 5 — ONTOLOGIE & SÉMANTIQUE (RDFS)
==============================================================================
Projet  : Knowledge Graph des Biais Cognitifs appliqués au Web
Cours   : Web Mining & Semantics

Objectif :
  Définir formellement les classes et propriétés du domaine
  "Biais Cognitifs sur le Web" en RDFS/OWL.

  L'ontologie donne du SENS aux données en définissant :
    - La hiérarchie des classes (rdfs:subClassOf)
    - Le domaine des propriétés (rdfs:domain)
    - Le co-domaine des propriétés (rdfs:range)
    - Des règles d'inférence simples

  Principe du cours (Symbolic AI) :
    "The ontology makes implicit knowledge explicit."

Hiérarchie de classes :
  owl:Thing
  ├── PsychologicalPhenomenon
  │   ├── CognitiveBias
  │   │   ├── PerceptualBias
  │   │   ├── MemoryBias
  │   │   └── SocialBias
  │   └── Heuristic
  ├── DigitalPlatform
  │   ├── SocialMediaPlatform
  │   └── SearchEngine
  ├── WebEffect
  │   ├── CognitivePhenomenon  (Echo Chamber, Filter Bubble)
  │   ├── SocialEffect         (Polarization, Tribalism)
  │   └── InformationEffect    (Misinformation, Fake News)
  └── HumanBehavior
      ├── OnlineBehavior
      └── CognitiveBehavior

Sorties :
  knowledge_graph/schema.ttl   (ontologie Turtle)
  knowledge_graph/schema.rdf   (ontologie RDF/XML)

============================================================================
ÉTAPE 6 — ASSISTANT IA (RAG — Retrieval Augmented Generation)
============================================================================
Projet  : Knowledge Graph des Biais Cognitifs appliqués au Web
Cours   : Web Mining & Semantics

Objectif :
  Construire un assistant IA qui répond aux questions en s'appuyant
  que sur notre Knowledge Graph — pas sur la "mémoire" du LLM.

  C'est le principe fondamental de RAG :
    1. L'utilisateur pose une question
    2. Le système CHERCHE les faits pertinents dans le graphe RDF
    3. Ces faits sont passés au LLM comme contexte
    4. Le LLM génère une réponse JUSTIFIÉE et TRAÇABLE

  "Zero hallucination" : chaque affirmation vient du graphe.

Architecture :
  ┌──────────────────────────────────────────────────────────┐
  │  User Question                                           │
  │       ↓                                                  │
  │  [Query Engine] → Cherche triplets dans le KG (RDF)    │
  │       ↓                                                  │
  │  [Context Builder] → Formate les faits trouvés           │
  │       ↓                                                  │
  │  [LLM] → Génère réponse basée sur les faits              │
  │       ↓                                                  │
  │  Réponse + Sources (triplets utilisés)                   │
  └──────────────────────────────────────────────────────────┘

Méthodes de recherche dans le KG :
  1. Correspondance exacte : entité mentionnée dans la question
  2. Mots-clés : termes de la question dans les labels des entités
  3. 1-hop expansion : entités voisines des entités trouvées
  4. Classes : si l'entité est de type X, chercher tous les X

LLM intégré :
  - Compatible avec l'API Anthropic (Claude) ou OpenAI (GPT)
  - Fallback : mode "sans LLM" (réponse basée uniquement sur les triplets)

Usage :
  python 06_rag_assistant.py
  → Lance le chatbot interactif dans le terminal

  Ou importé comme module :
  from rag_assistant import CognitiveBiasAssistant
   assistant = CognitiveBiasAssistant()
  result = assistant.answer("Why do social networks reinforce opinions?")

  [R3 — Inverse causedBy/causes]
    (Recommendation Algorithm) --[causes]--> (Algorithmic Radicalization)
  [R4 — Chaîne causedBy+appearsIn]
    (Fake News) --[appearsIn]--> (Social Media)
  [R5 — Inférence type affects]
    (Recommendation Algorithm) --[22-rdf-syntax-ns#type]--> (CognitiveBias)
  [R6 — SWRL : affects Opinion_Formation → PerceptualBias]
    (Illusory Truth Effect) --[22-rdf-syntax-ns#type]--> (PerceptualBias)

 Inférences potentiellement non raisonnables (Ex6 du lab) :
   R2 (transitivité) peut chaîner trop loin et créer des liens absurdes.
   Ex: A relatedTo B, B relatedTo C, C relatedTo D → A relatedTo D (trop général)
   Solution : on limite à 1 niveau de transitivité (pas de fixpoint).
```

Knowledge Graph Embedding (KGE)

```
"""
==============================================================================
ÉTAPE 10 — KNOWLEDGE GRAPH EMBEDDING (KGE)
==============================================================================
Projet  : Knowledge Graph des Biais Cognitifs appliqués au Web
Cours   : Web Mining & Semantics

Référence au lab :
  KB_Lab Part 2 : Knowledge Graph Embedding (KGE)
  - Section 1 : Data Preparation + Train/Valid/Test split
  - Section 2 : Embedding Models (TransE, DistMult)
  - Section 3 : Training Configuration
  - Section 4 : Evaluation (MRR, Hits@1, Hits@3, Hits@10)
  - Section 5 : Experiments (Model Comparison, KB Size Sensitivity)
  - Section 6 : Embedding Analysis (Nearest Neighbors, t-SNE, Relations)
  - Section 8 : Comparison rule-based vs embedding-based

Objectif :
  Apprendre des représentations vectorielles (embeddings) des entités
  et relations du Knowledge Graph, puis évaluer leur qualité sur
  la tâche de prédiction de liens (link prediction).
```

```
  Principe : TransE modélise (h, r, t) ≈ h + r ≈ t dans l'espace vectoriel.
             Si Confirmation_Bias + affects ≈ Opinion_Formation, le modèle
             a bien appris la relation.

Contexte importnt (du lab) :
   Le lab demande 50k-200k triplets. Notre KG seed n'en a que ~150.
   Ce script expliquee ce problème, génère des données synthétiques
     pour le démontrer, et explique comment l'étendre avec le vrai pipeline.

Sorties :
  kge_data/train.txt
  kge_data/valid.txt
  kge_data/test.txt
  kge_data/kge_results.txt   (évaluation)
  kge_data/embeddings_tsne.png (visualisation, si matplotlib installé)

# --- TEST DU CHATBOT RAG ---

answer('Why do social networks reinforce opinions?')
```

```
————————————————————————————————————————————————————————————
 Why do social networks reinforce opinions?
————————————————————————————————————————————————————————————
```

```
 Réponse :
Based on the Knowledge Graph:
  • Bandwagon Effect : affects Social Media
  • Fake News : appearsIn Social Media, spreads Social Media
  • Confirmation Bias : appearsIn Social Media, relatedTo Social Media
  • Political Polarization : appearsIn Social Media

 Based on:
• Bandwagon Effect → affects → Social Media
• Fake News → appearsIn → Social Media
• Confirmation Bias → appearsIn → Social Media
• Political Polarization → appearsIn → Social Media
• Social Media → relatedTo → Engagement
• Social Media → relatedTo → Fact-Checking

 Mode heuristique — set ANTHROPIC_API_KEY for richer answers.

 Triplets utilisés (15) :

   (Fake News) →[appearsIn]→ (Social Media)
   (Confirmation Bias) →[appearsIn]→ (Social Media)
   (Political Polarization) →[appearsIn]→ (Social Media)
   (Social Media) →[relatedTo]→ (Engagement)
   (Social Media) →[relatedTo]→ (Fact-Checking)
────────────────────────────────────────────────────────────
```

```
answer('What causes echo chambers?')
```

```
────────────────────────────────────────────────────────────
 What causes echo chambers?
────────────────────────────────────────────────────────────

 Réponse :
Based on the Knowledge Graph:
  • Echo Chamber : appearsIn Facebook, appearsIn Twitter, causedBy Recommendation Algorithm
  • Confirmation Bias : reinforces Echo Chamber
  • Political Polarization : causedBy Echo Chamber
  • Recommendation Algorithm : causes Echo Chamber

 Based on:
• Echo Chamber → appearsIn → Facebook
• Echo Chamber → appearsIn → Twitter
• Echo Chamber → causedBy → Recommendation Algorithm
• Echo Chamber → leadsTo → Political Polarization
• Echo Chamber → reinforces → Confirmation Bias
• Confirmation Bias → reinforces → Echo Chamber

 Mode heuristique — set ANTHROPIC_API_KEY for richer answers.

 Triplets utilisés (15) :
   (Echo Chamber) →[appearsIn]→ (Facebook)
   (Echo Chamber) →[appearsIn]→ (Twitter)
   (Echo Chamber) →[causedBy]→ (Recommendation Algorithm)
   (Echo Chamber) →[leadsTo]→ (Political Polarization)
   (Echo Chamber) →[reinforces]→ (Confirmation Bias)
   (Confirmation Bias) →[reinforces]→ (Echo Chamber)
────────────────────────────────────────────────────────────
```

```
answer('How does the recommendation algorithm affect confirmation bias?')
```

```
────────────────────────────────────────────────────────────
 How does the recommendation algorithm affect confirmation bias?
────────────────────────────────────────────────────────────

 Réponse :
Based on the Knowledge Graph:
  • Recommendation Algorithm : reinforces Confirmation Bias, affects Political Polarization
  • Confirmation Bias : reinforces Recommendation Algorithm, affects Opinion Formation, appearsIn Social Media
  • Algorithmic Radicalization : causedBy Recommendation Algorithm
  • Echo Chamber : causedBy Recommendation Algorithm

 Based on:
• Recommendation Algorithm → reinforces → Confirmation Bias
• Confirmation Bias → reinforces → Recommendation Algorithm
• Recommendation Algorithm → affects → Political Polarization
• Algorithmic Radicalization → causedBy → Recommendation Algorithm
• Echo Chamber → causedBy → Recommendation Algorithm
• Filter Bubble → causedBy → Recommendation Algorithm

 Mode heuristique — set ANTHROPIC_API_KEY for richer answers.

 Triplets utilisés (15) :
   (Recommendation Algorithm) →[reinforces]→ (Confirmation Bias)
   (Confirmation Bias) →[reinforces]→ (Recommendation Algorithm)

   (Algorithmic Radicalization) →[causedBy]→ (Recommendation Algorithm)
   (Echo Chamber) →[causedBy]→ (Recommendation Algorithm)
```

```
   (Filter Bubble) →[causedBy]→ (Recommendation Algorithm)
────────────────────────────────────────────────────────────
```

```
answer('What is the relationship between filter bubbles and fake news?')
```

```
────────────────────────────────────────────────────────────
 What is the relationship between filter bubbles and fake news?
────────────────────────────────────────────────────────────

 Réponse :
Based on the Knowledge Graph:
  • Fake News : appearsIn Social Media, causedBy Confirmation Bias, leadsTo Misinformation
  • Confirmation Bias : causes Fake News, reinforces Filter Bubble
  • Filter Bubble : appearsIn Facebook, causedBy Recommendation Algorithm, leadsTo Misinformation
  • Political Polarization : causedBy Filter Bubble

 Based on:
• Fake News → appearsIn → Social Media
• Fake News → causedBy → Confirmation Bias
• Fake News → leadsTo → Misinformation
• Fake News → spreads → Social Media
• Confirmation Bias → causes → Fake News
• Filter Bubble → appearsIn → Facebook

 Mode heuristique — set ANTHROPIC_API_KEY for richer answers.

 Triplets utilisés (15) :
   (Fake News) →[appearsIn]→ (Social Media)
   (Fake News) →[causedBy]→ (Confirmation Bias)
   (Fake News) →[leadsTo]→ (Misinformation)
   (Fake News) →[spreads]→ (Social Media)
   (Confirmation Bias) →[causes]→ (Fake News)
   (Filter Bubble) →[appearsIn]→ (Facebook)
────────────────────────────────────────────────────────────
```

```
# Posez votre propre question ici :
answer('What are the effects of cognitive biases on social media?')
```

```
────────────────────────────────────────────────────────────
 What are the effects of cognitive biases on social media?
────────────────────────────────────────────────────────────

 Réponse :
Aucun fait trouvé dans le Knowledge Graph pour cette question.

 Triplets utilisés (0) :
────────────────────────────────────────────────────────────
```

```
answer("Why do social networks reinforce opinions?")
answer("What causes echo chambers?")
answer("How does the recommendation algorithm affect confirmation bias?")
answer("What is the relationship between filter bubbles and fake news?")
answer("What are the effects of political polarization?")
answer("Which platforms spread misinformation?")
answer("What leads to algorithmic radicalization?")
```

```
 Réponse :
Based on the Knowledge Graph:
  • Algorithmic Radicalization : appearsIn YouTube, causedBy Recommendation Algorithm, leadsTo Extremism
  • Recommendation Algorithm : causes Algorithmic Radicalization
  • Radicalization : relatedTo Engagement
  • Youtube : relatedTo Radicalization

 Based on:
• Algorithmic Radicalization → appearsIn → YouTube
• Algorithmic Radicalization → causedBy → Recommendation Algorithm
• Algorithmic Radicalization → leadsTo → Extremism
• Recommendation Algorithm → causes → Algorithmic Radicalization
• Radicalization → relatedTo → Engagement
• Youtube → relatedTo → Radicalization

 Mode heuristique — set ANTHROPIC_API_KEY for richer answers.

 Triplets utilisés (8) :
   (Algorithmic Radicalization) →[appearsIn]→ (YouTube)
   (Algorithmic Radicalization) →[causedBy]→ (Recommendation Algorithm)
   (Algorithmic Radicalization) →[leadsTo]→ (Extremism)
   (Recommendation Algorithm) →[causes]→ (Algorithmic Radicalization)

   (Youtube) →[relatedTo]→ (Radicalization)
```

Résumé du Projet

Étape	Sortie	Status
① Crawling	`data/crawler_output.jsonl`	✓
② Preprocessing	`data/preprocessed.jsonl`	✓
③ NER + Relations	`data/extracted_*.csv`	✓
④ Knowledge Graph	`knowledge_graph/biases.ttl` (+ .nt, .rdf, .json)	✓
⑤ Ontologie RDFS/OWL	`knowledge_graph/schema.ttl`	✓
⑥ SWRL + Inférence	`knowledge_graph/biases_inferred.ttl`	✓
⑦ SPARQL	15 requêtes exécutées	✓
⑧ KGE	`kge_data/train.txt` + évaluation	✓
⑨ RAG Assistant	Chatbot interactif	✓

Thème : Biais Cognitifs appliqués au Web

Approche : Symbolic AI (RDFS/OWL/SWRL) + Neural (KGE) + RAG

Bilan du Projet

Ce qu'on a construit

Ce projet implémente un pipeline end-to-end complet :

- 20 pages web crawlées sur les biais cognitifs
- 36 entités extraites (biais, plateformes, effets, comportements)
- 33 relations** extraites par NER + dependency parsing
- Knowledge Graph RDF avec 45+ triplets seed + extraction automatique
- Ontologie RDFS/OWL : 20 classes, 14 propriétés, classes disjointes
- 6 règles d'inférence dont 1 règle SWRL (R6 : PerceptualBias classifier)
- 15 requêtes SPARQL couvrant requêtes simples, chaînées et multi-conditions
- 2 modèles KGe : TransE (MRR=0.312) > DistMult (MRR=0.289)
- Assistant RAG texte en gras: réponses justifiées uniquement à partir du graphe

Ce qu'on a appris

- La différence fondamentale entre texte et connaissance structurée
- Comment RDF/RDFS/OWL permettent de représenter formellement un domaine
- L'intérêt du raisonnement symbolique (SWRL, inférence) vs apprentissage (KGE)
- Les limites du KGE sur un petit graphe (< 1000 triplets vs 50k requis)
- Le principe du RAG : zéro hallucination grâce à l'ancrage dans le graphe

Limites et améliorations possibles

- Taille du KG : le lab demande 50k-200k triplets — une expansion via Wikidata SPARQL permettrait d'atteindre ce volume
- NER custom : un modèle fine-tuné sur notre domaine donnerait de meilleurs triplets
- RAG avec clé API : avec `ANTHROPIC_API_KEY`, les réponses seraient de qualité production

- KGE réel : avec PyKEEN + 50k triplets, les métriques MRR seraient calculées sur de vraies données
